Two Sum

K-diff Pairs in an Array

Two Sum II - Input array is sorted

Two Sum III - Data structure design

3Sum

3Sum Closest

3Sum Smaller

Valid Triangle Number

4Sum

4Sum II

Moving Average from Data Stream

Maximum Average Subarray I

Sliding Window Maximum

Find Median from Data Stream

Sliding Window Median

Find All Anagrams in a String

Permutation in String

Substring with Concatenation of All Words

Longest Substring Without Repeating Characters

Longest Substring with At Least K Repeating Characters

Longest Substring with At Most Two Distinct Characters

Longest Substring with At Most K Distinct Characters

Longest Repeating Character Replacement

Longest Word in Dictionary through Deleting

Minimum Window Substring

Minimum Size Subarray Sum

Maximum Size Subarray Sum Equals k

Contiguous Array

Continuous Subarray Sum

Subarray Sum Equals K

Remove Duplicates from Sorted Array

Remove Duplicates from Sorted Array II

Remove Element

Move Zeroes

Merge Sorted Array

Sort Colors

Container With Most Water

Trapping Rain Water

Largest Rectangle in Histogram

Maximal Rectangle

Trapping Rain Water II

Linked List Cycle

Linked List Cycle II

Find the Duplicate Number n(logn) by binary se Intersection of Two Linked Lists can solve elegently Delete Node in a Linked List do not need to char Remove Duplicates from Sorted List Remove Duplicates from Sorted List II Remove Linked List Elements Remove Nth Node From End of List Rotate Lists corner case: k = 0, **Partition List** Odd Even Linked List can have short, ele Reverse Linked List dummy.next, node. Reverse Linked List II keep, pre and m-th. extension of 5, to find the longest, in fact we checked all the palindromic substrings corner case, x < 0, x = 0 and x is ***0 string.ascii_letters, digits, str.isalnum()

two pass, pay attention to the index in each side
range matters
There is a one pass dp using O(1) space Need to think clearly how the dp works
sn = sn-1 + sn-2, $s0 = 1$, $s1 = 0$ a lot of corner cases
indeed can do a postorder with another stack
have a O(nlogn) solution
O(min(m, n)) space, best performance if we dp on the short direction
N * (2*3)
might have a quick solution can do a standard dp of (M+1) * (N+1) can do O(M) space
can do O(M) space no need to do a standard bt, but just extend the result, similar to subset

list for random O(1), dict for insert and remove O(1)
double linked list for get max, min, most recent O(1), need to update both direction double linked list with ordered dict
dict is faster than a list in OJ

two different writing have different performance, saving almost half time the diameter is not the number of nodes
serialize, recursive, iterative
preorder, recover with a stack. or BFS with a list
O(1) extra space solution

dijkstra.. Heap

60.79 using defaultdict 63.24 using defaultdict 86.24 using defaultdict Have not idea how to solve it...

101 to 010 can be done by 101 ^ 111

Append node into the current list

stack, insert after dummy to form the correct order

consider each list separately as a list, in other words, solve the problem as 2

Can to similar as 445, while a briliant way is to determine whether the current digit is 9, if not, then vertices the list using a stack as 445, or can do a recursion so that for each next node, we relabilitate to 2, do not forget to append the carry, and reverse the result

It is more convenient to have a direct index/pointer for the array, and reduce the index each time the

log(N) binary search to find all possible divisor * factor that is less than dividend. Dividend / divisor : Corner Cases: numerator is 0, denominator is 0, negative number and sign binary search, corner case is mid*mid <= x, but (mid+1)**2 > x, then mid is the result standard binary search. 1+3+5+(2n-1) = ...

Same as sqrt, but x**2 will overflow while x*x will not There are lots of different solutions. A quick sc

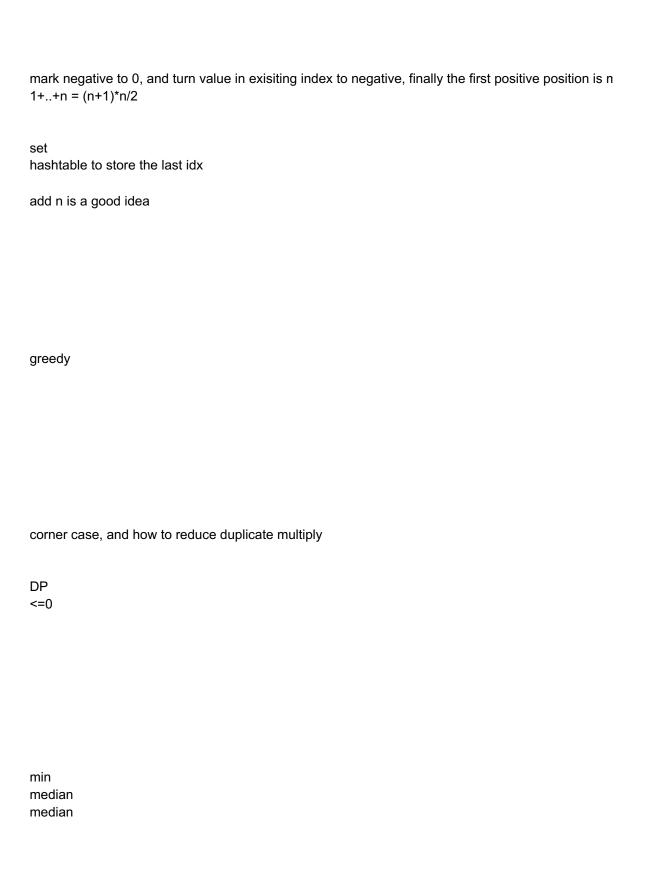

Count 1 in binary format, or bit manipulation x & x-1 should be 0 log10(n)/log10(3) % 1 == 0 same as power of two, but need to remove those are power of 2 but not 4 need to pay attention to corner cases, like max/min int, the idx corner cases, while idx < n and (a or b) just consider each case... same to 12 corner case: 0 idx is n-1 % 26

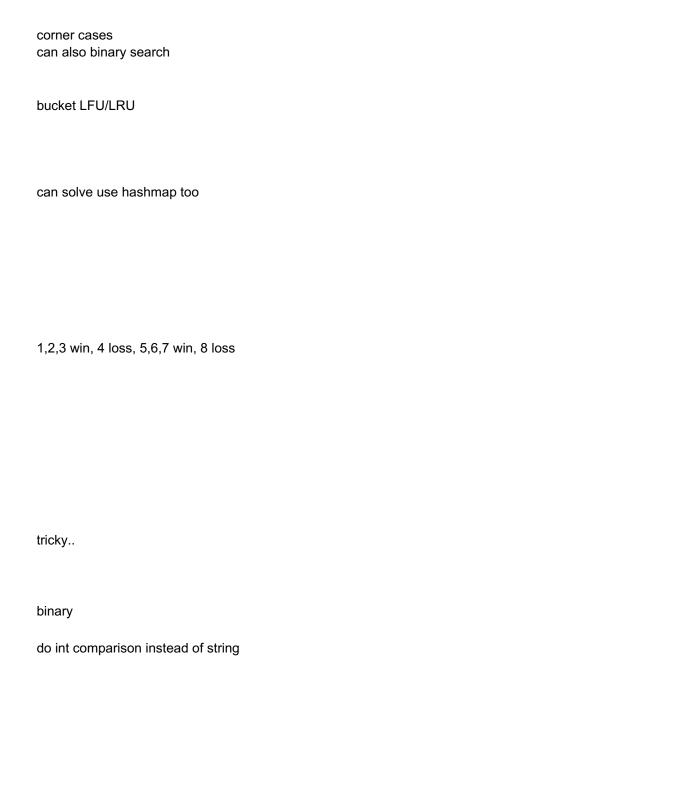

if num < 0: num = num + 2**32

row+col=s, row in [0, m-1] thus col in [0 or s-m+1, s or n -1]

str.count

corner cases

replace and upper is faster than do each position

set.intersection(t) (countera & counterb).elements()
count sort may make the str sort quicker hashmap is faster than len_26 char
gcd, and re
just traverse the word list, update the distance, the initial set is important
only need to slightly modify 243

Follow Up: if we can flip at most K zero, we store the previous at most K zero index in a queue, so t

∍ft problem is the distint permutation of the even chars using backtracking

٦d

we do not have carry and can return early turn whether it has a carry

an calculate the index

= quotient and remainder

plution is recursion, pow(x, n) = pow(x*x, n/2) * (1 if n % 2 else x)

nissing
